

My Experience Creating a Portfolio Website

A few weeks ago, I got an assignment to create a portfolio website individually. In this project, I used HTML, CSS, Bootstrap, and a little JavaScript to make an attractive and modern website design. The website contains several sections such as Home, About Me, Skills, Project, and Contact. At the beginning of the project, I searched for design inspiration from the internet and YouTube. After that, I started creating the layout and choosing the website color theme. I chose dark blue combined with cyan colors to make the website look elegant and futuristic.

During the process, I faced several difficulties, especially when arranging the layout and making the website responsive on different screen sizes. Sometimes some CSS styles did not work as I expected, so I had to try many times to fix them. However, from those mistakes, I learned more about how HTML, CSS, and Bootstrap work. My favorite part was creating the Skills and Project sections because I could show the websites that I had made before. I also added icons, animations, and progress bars to make the website look more interesting and not monotonous.

Through this experience, I learned that creating a website requires patience, creativity, and accuracy. Besides improving my coding skills, this assignment also made me more confident to continue learning and developing my skills in web development.
